

## PROVINCIAL ENERGY PLAN FOR AGRICULTURE, FISHERIES AND LIVESTOCK (AFL) SECTORS IN THE EASTERN PROVINCE

Under the Biogas, Biomass and Solar Trilateral Cooperation Project

November 2021

Prepared by Eng. M. M. R. Padmasiri

Prepared For United Nations Development Programme (UNDP) in Sri Lanka

United Nations Office for South-South Cooperation

## **Acknowledgement**

This Provincial Energy Plan for the Eastern Province was prepared as an assignment under the Biogas, Biomass and Solar Trilateral Cooperation-Transitioning to Sustainable Energy Uses in the Agro-Industry for UNDP Sri Lanka. The project is supported by the Ministry of Commerce of China and Sustainable Energy Authority of Sri Lanka and implemented by UNDP Sri Lanka and UNDP China.

I wish to express my sincere thanks to UNDP Sri Lanka for the trust and confidence placed in me by entrusting this task and thereafter very enthusiastic encouragement, assistance and excellent cooperation extended by the Project Management Unit guided by Dr. Buddika Hapuarachchi -Policy Specialist and Team Leader, Climate and Environment Team and Ms. Sureka Perera -Programme Quality & Design Analyst and led by Mr. Sampath Ranasinghe (Programme Coordinator), Eng. Suranga Karavita (Technical Coordinator) and Mr. Dasitha Premarathne (Project Assistant) in performing this task.

On behalf of UNDP project Management unit, I highly value and appreciate the guidance and support given by the partners of the project, Professor Dong Renjie and Dr Zhou Yuguang Associate Professor of the Chinese Agricultural University, Officials of Administrative Centre for China's Agenda 21 (ACCA 21) and Regional Coordinator Dr. Denis Nkala, and team of the UNOSCC for making this valuable exercise possible.

I also appreciate and highly value the guidance and support given the provincial council in preparing the provincial energy plan lead by the Chief Secretary Mr. Thusitha P. Wanigasinghe, Secretary (Ministry of Agriculture) Mr. I. K. G. Muthubanda, Director Planning (Ministry of Agriculture) Dr. R. Gnanasekar, Provincial Director (Department of Animal Production & Health) Dr. M. A. M. Fazi, Provincial Director (Ministry of Fisheries) Mr. S. Suthaharan and all the other relevant staff members of respective ministries and departments of the province who supported.

Last but not least, I wish to express my sincere thanks and profound gratitude to all other parties without whose valuable contribution this report would not have been possible including district level officers, farmers and all others.

## **EXECUTIVE SUMMARY**

Energy and agriculture sectors are the largest Green-House Gas (GHG) emitters in Sri Lanka, representing around 59%, and 27% respectively of the total national GHG emissions (SNC, 2011). Thus, implementing energy efficiency measures and renewable energy technologies (RETs) in these sectors can have a significant impact in terms of emission reductions apart from significant socio-economic benefits to the country. However, the energy use and the energy generation (eg. Biogas) in agriculture, fisheries and livestock practices are not separately accounted in national or provincial level energy balances yet. The main reason may be the practical difficulties of collection of reliable and accurate data from the fields due to decentralized and scattered nature of operation. This report has been developed under the Biogas, Biomass and Solar Trilateral South South Cooperation (TSCC) Project which has been implemented with the objectives of introducing technologies and systems to enhance the Sustainable Energy Use in the Agriculture, Fisheries and Livestock (AFL) sector in Sri Lanka. Production and semi production process of the above mentioned sectors have been considered as the boundary of this analysis and technically viable renewable energy technologies have been analyzed and included in this action plan.

*Agriculture Sector:* There are about 173,800 hectares of agricultural land in Eastern Province, and out of this about 143,780 hectares are paddy lands, 24,340 ha are vegetable cultivating lands and around 4,100 ha are fruit cultivating lands. The highest paddy production in Sri Lanka is recorded in the Eastern Province and out of the total agricultural land use, nearly 83% are paddy land. Rain fed cultivation system is followed in most of the areas in Eastern province and the yield is considerably higher in 'Maha' season.

Around 137.043 million liters of auto diesel, 87.708 million liters of petrol (Octane 92) and 766.47 GWh of electricity was used in 2019 [9] in Eastern Province. Out of these around 17.12% of diesel, 2.66% of petrol and 0.19% of electricity is used in agriculture sector.

The energy consumption in paddy cultivation is the highest in Eastern Province and rest of the energy is shared equally among vegetable and fruits cultivation. Out of the total energy consumption in agriculture sector (cultivation) land preparation and harvesting consume 64% and 18% respectively. Water pumping is the next and it shares around 8.0% of the total energy. In short rotation vegetable crops, more than 50% of total energy consumption shares are for water pumping and approximately 33% for land preparation.

*Fisheries Sector:* Production and semi production processes in marine fishing, inland fishing, ornamental fishing and shrimp farming are considered as the boundary of this report under fisheries sector. There are no field level fish storage facilities in the Eastern Province and all the stocks are sent to the processing centers just after harvesting.

Marine fishing is carried out in all the three districts in Eastern Province. The total annual marine fish production is in the range of 60,000 to 65,000 tons per annum and this shares approximately 15.0% of the national marine fish requirement [8].

Inland fishing is also popular in the Eastern Province and it contributes to supplying around 22.5% of the inland fish requirement of the country amounting 20,120 tons per annum [8]. Out of this Eastern province total inland fish production, nearly 62% comes from Ampara District. There are about 300 perennial tanks for farming inland fish in Eastern Province.

Puttalam and Batticaloa are the two Districts producing shrimp in the country and out of the total 15% of production comes from Batticaloa District.

Out of the total energy use in Eastern province, around 14.7% of diesel consume in multi day boats and 0.31% of electricity is used in paddlewheels in shrimp farms. The total kerosene and petrol use in eastern province is around 110.311 million liters annually and out of these around 28.7% is used in single day boats.

*Livestock Sector:* Livestock sector productions and earnings in the Eastern province is contributing substantially to the national GDP in Sri Lanka annually. Out of the total national requirement, about 6.3% of cow milk, 16.2% of buffalo milk, 43.5% of beef and 31.0% of mutton is produced in the Eastern province [7]. Eastern province is the biggest beef and mutton producer to the local consumption.

In addition to this buffalo milk is processed, producing curd in the Eastern province in substantial level. Kanthale area in Trincomalee district is popular for curd production, and in most of the places processing is done as a domestic industry.

Energy use in livestock sector is not significant and most of the activities are carrying out as a domestic industry.

*Action Plan:* This report presents a comprehensive activity plan to optimize the energy use in the Agro-Industry including agriculture, fisheries, and livestock sectors. The activity plan introduces 8 sector specific and cross sectoral interventions diverging in to 18 sub activities covering all major aspects including training and capacity building, renewable energy technology development, and financial mechanisms.

The energy share for land vehicles (land preparation and harvesting activities) in agriculture sector has been identified as the major contributor in the energy balance. Enhancement of energy efficiency in these machineries have been identified as one of the important activity but this has to be done in national level. Setting standards and quality control measures on machinery imports is more appropriate, as it will gradually lead efficient equipment to penetrate in to the market. Regulatory provisions are already available in section 35(2) and 36(2) of Sri Lanka Sustainable Energy Authority act no 35, 2007 for this purpose.

*NDC Actions*: Government of Sri Lanka submitted updated nationally determined contributions (NDCs) in July 2021 and it is expected to achieve a reduction of GHG emissions against the BAU scenario by 7% in the agriculture and livestock sectors (4% unconditionally and 3% conditionally) equivalent to an estimated mitigation level of 2,477,400 MT CO2e unconditionally and 1,858,000 MT CO2e conditionally (total of 4,335,400 MT CO2e) of carbon dioxide equivalent during the period of 2021 to 2030 by implementing the updated NDCs. Energy related sub NDC actions in agriculture and livestock sectors have been identified under this NDC submission and implementation of this action plan will give an additional support when reporting the achievements of the above targets.

## CHAPTER 1: INTRODUCTION

### **1.1 INTRODUCTION TO THE REPORT**

This report has been developed under the Biogas, Biomass and Solar Trilateral South South Cooperation (TSCC) Project which has been implemented with the objectives of introducing technologies and systems to enhance the Sustainable Energy Use in the Agriculture, Fisheries and Livestock (AFL) sector in Sri Lanka. This is a 2-year project and the Sri Lanka Sustainable Energy Authority (SLSEA), Ministry of Power and Energy, and the Provincial Councils (Five Provinces-North Western, Southern, Uva, Eastern and Northern) are the project implementing partners whereas UNDP Sri Lanka provides the implementation support through Direct Implementation Modality (DIM).

Agriculture, fisheries and livestock (AFL) sectors have been considered under this report as the Agro-Industry prevailing in the Eastern Province. Production and semi production process of the above mentioned sectors have been considered as the boundary of this analysis and technically viable renewable energy technologies have been analyzed and included in this action plan.

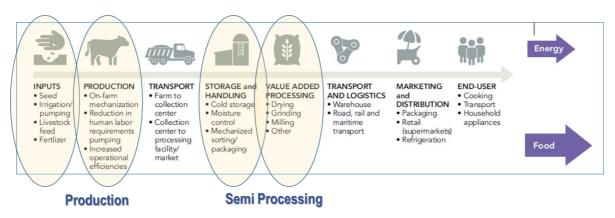

Figure 1.1: Boundary of this analysis reprot

*Exceptions:* Plantation sector (Tea, rubber, coconut, cashew etc.) and industry sector (Ice making etc.) are not covered under this analysis since these sectors have been addressed under other sectors.

## 1.2 BACKGROUND

Energy and agriculture sectors are the largest Green-House Gas (GHG) emitters in Sri Lanka, representing around 59%, and 27% respectively of the total national GHG emissions (SNC, 2011). Thus, implementing energy efficiency measures and renewable energy technologies (RETs) in these sectors can have a significant impact in terms of emission reductions apart from significant socio-economic benefits to the country. However, the energy use and the energy generation (eg. Biogas) in agriculture, fisheries and livestock practices are not separately accounted in national or provincial level energy balances yet. The main reason may be the practical difficulties of collection of reliable and accurate data from the fields due to decentralized and scattered nature of operation.

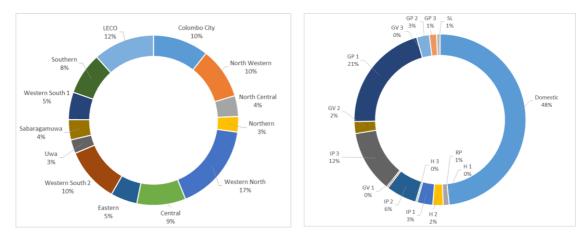

Fig 1.2: Electricity share by province

Fig 1.3: Electricity share by different categories in EP

Government of Sri Lanka submitted updated nationally determined contributions (NDCs) in July 2021 and it is expected to achieve a reduction of GHG emissions against the BAU scenario by 7% in the agriculture and the livestock sectors (4% unconditionally and 3% conditionally) equivalent to an estimated mitigation level of 2,477,400 MT CO<sub>2e</sub> unconditionally and 1,858,000 MT CO<sub>2e</sub> conditionally (total of 4,335,400 MT CO<sub>2e</sub>) of carbon dioxide equivalent during the period of 2021 to 2030 by implementing the updated NDCs [2]. Adoption of renewable energy technologies in crop farming, livestock applications have been identified as prospective NDCs under this report.

#### **1.3 AGRICULTURE SECTOR - EASTERN PROVINCE**

#### 1.3.1 OVERVIEW

The energy use in crop cultivation and semi processing such as threshing & winnowing have been considered as the boundary of this analysis. There are about 173,800 hectares of agricultural land in Eastern Province, and out of this about 143,780 hectares are paddy lands, 24,340 ha are vegetable cultivating lands and around 4,100 ha are fruit cultivating lands. [6].

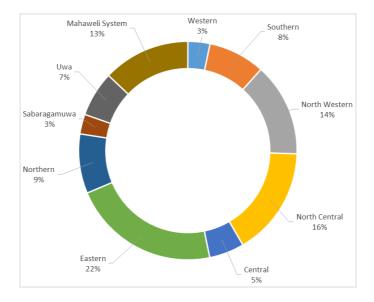

Fig 1.4: Share of paddy cultivation area by province

The highest paddy production in Sri Lanka is recorded in the Eastern province and out of the total agricultural land use, nearly 83% are paddy land. Rain fed cultivation system is followed in most of the areas in Eastern province and the yield is considerably higher in 'Maha' season.

## 1.3.2 ENERGY USE

Around 137.043 million liters of auto diesel, 87.708 million liters of petrol (Octane 92) and 766.47 GWh of electricity was used in 2019 in eastern province. Out of these around 17.12% of diesel, 2.66% of petrol and 0.19% of electricity is used in agriculture sector.

Water pumping is the major energy consumer in vegetable cultivation. Approximately out of the total energy use in vegetable cultivation, 56% in terms of energy, and 57% in terms of cost of energy shares in water pumping. Next to water pumping, energy requirement for land preparation holds the other major share. Energy consuming machineries such as sprayers, mini tillers etc. are used in agriculture industry but the energy or energy cost share is negligible. The detailed analysis of energy use is given in Chapter 4.

#### 1.3.3 IMPLEMENTED AND ONGOING PROGRAMMES

#### 1.3.3.1 Projects Implemented by the Ministry of Agriculture - EP

Ministry of Agriculture in Eastern Province is providing agriculture machineries to the farmers at 50% or 100% grant basis annually and the summary of the projects implemented are given in the following table.

Projects Details (Related to Energy) EP - Agriculture				
Year	Project	No of Beneficiaries	Specifications	Unit Cost - LKR
2021				
				<u></u>
	Details to be comple	Details to be completed by the Ministry of Agriculture - EP		
2020				
2018/19				

#### 1.4 LIVESTOCK SECTOR

#### 1.4.1 OVERVIEW

Livestock sector productions and earnings in the Eastern province is contributing substantially to the national GDP in Sri Lanka annually. Out of the total national requirement, about 6.3% of cow milk, 16.2% of buffalo milk, 43.5% of beef and 31.0% of mutton is produced in the Eastern province [7]. Eastern province is the biggest beef and mutton producer to the local consumption.

In addition to this buffalo milk is processed, producing curd in the Eastern province in substantial level. Kanthale area in Trincomalee district is popular for curd production, and in most of the places processing is done as a domestic industry.

### 1.4.2 ENERGY USE

Firewood is the major energy source used for heating the milk in curd making process and due to lack of process control mechanism, the quality of product is varying from time to time.

In addition to the energy usage, substantial amount of energy is generated through biogas for domestic usage in this sector. Use of evaporative cooling technology in broiler chicken industry and use of coolers for preserving milk are the major energy utilizers in livestock sector. Apart from this this, water is being used in different stages in all the meet and egg production processes and there is not much detail recorded on that.

#### **1.5 FISHERIES SECTOR**

#### 1.5.1 OVERVIEW

Production and semi production processes in marine fishing, inland fishing, ornamental fishing and shrimp farming are considered as the boundary of this report under fisheries sector. There are no field level fish storage facilities in the Eastern Province and all the stocks are sent to the processing centers just after harvesting.

Marine fishing is carried out in all the three Districts in Eastern Province. The total annual marine fish production is in the range of 60,000 to 65,000 tons per annum and this shares approximately 15.0% of the national marine fish requirement [8].

Inland fishing is also popular in the Eastern Province and it contributes to supplying around 22.5% of the inland fish requirement of the country amounting 20,120 tons per annum [8]. Out of this Eastern province total inland fish production nearly 62% comes from Ampara district. There are about 300 perennial tanks for farming inland fish in Eastern Province.

Puttalam and Batticaloa are the two Districts producing shrimp in the country and out of the total 15% of production comes from Batticaloa District [8].

#### 1.5.2 ENERGY USE

Fuel use in multi day boats, single day boats and electricity usage in ice production process are the major energy utilizing areas in fisheries sector. In addition to this, electricity or diesel use in aerators and water pumping in shrimp farming and ornamental fish farming accounts for substantial amount of energy.

#### 1.5.3 IMPLEMENTED AND ONGOING PROGRAMMES

There are no significant energy related projects that have been implemented in the Eastern Province during recent past. Street light project has been implemented in a few small harbors but most of such lanterns are not operating now, may be due to damage or sometimes thefts.

## 1.6 ASSISTANCE FOR IMPLEMENTATION OF GREEN ENERGY IN THE EASTERN PROVINCE

#### 1.6.1 NAMA PROJECT

Nationally Appropriate Mitigation Actions (NAMA) in the Energy Generation and End-use Sectors in Sri Lanka Project was executed by the United Nations Development Programme (UNDP), Sri Lanka Sustainable Energy Authority (SLSEA), and the Climate Change Secretariat of Sri Lanka (CCS) to support appropriate climate change mitigation actions in the energy generation and end-use sectors as part of the initiatives to achieve the voluntary GHG mitigation targets of Sri Lanka and to develop a robust, transparent and functional NAMA framework along with clear inventory and Monitoring, Reporting, and Verification (MRV) system with supporting governance and oversight in Sri Lanka that will systematically quantify Green House Gas (GHG) savings and benefits of the mitigation interventions using a bottom up approach to aggregate from the provincial and sub-sector levels to the national and sectors level.

Under this NAMA project biogas technology has been piloted for testing of MRV system and had introduced 39 biogas units in different scale with the total digester volume of 846 m<sup>3</sup>. Part financing was made as grants under the NAMA project.

## 1.6.2 ELECTRICITY TARIFF FOR AGRICULTURE SECTOR

Agriculture, fisheries, and livestock sectors have been included in to industry category under the CEB tariff structure and separate tariff has been announced by the Government of Sri Lanka on 06<sup>th</sup> March 2015 but it has been noticed that no one is aware about this initiative. The electricity bill can be brought down with this new tariff structure.

Colombo 03.		

#### 1.6.3 AGRICULTURE SECTOR MODERNIZATION PROJECT

Agriculture Sector Modernization Project has been initiated with the assistance of the World Bank and the objective is to support increasing agriculture productivity, improving market access, and enhancing value addition of smallholder farmers and agribusinesses in the project areas. More specifically seeks to promote commercial and export-oriented agriculture; attract and leverage investments from farmer producer organizations and agribusinesses for high value agriculture production and value addition; and provide the enabling environment, incentives, and access to finance for such investments through matching grants, technical assistance support, linkages to the commercial banking sector, and a Partial Credit Guarantee (PCG) facility. Also, the project is aiming enhancement of productivity through supporting smallholder farmers to produce competitive and marketable commodities, improve their ability to respond to market requirements, and move towards increased commercialization.

#### 1.7 BARRIERS TO IMPLEMENTATION

The energy usage in the AFL sector has not been properly accounted in national or regional level energy balance sheets and due to this less attention has been paid on implementation of energy efficiency or renewable energy projects in these sectors. To overcome this issue a separate chapter is recommended in the national energy balance published by Sri Lanka Sustainable Energy Authority.

Lack of end user awareness, lack of technical capacity among end users and officials in the AFL sectors on renewable energy and energy efficiency technologies are some of other challenges faced when implementing energy projects. Comprehensive training and capacity building programmes are essential to overcome these issues. Also, demonstration of new technologies and systems through pilot projects can overcome most of these issues.

Even though the regulatory mechanisms are in place to eliminate the low-quality solar energy powered products coming in to the local market, low-quality products are still available and it is very difficult to recognize the best product by visual inspection. With this situation, the level of confidence about these appliances among the farmer community is decreasing day by day.

Lack of consistent market and price structure for agriculture products is another barrier to developing agriculture sector as expected. Due to weather conditions or seasonal variation, crop prices are varying rapidly in Sri Lanka and it is difficult to predict the market. With this background farmers are reluctant to invest as such for system developments.

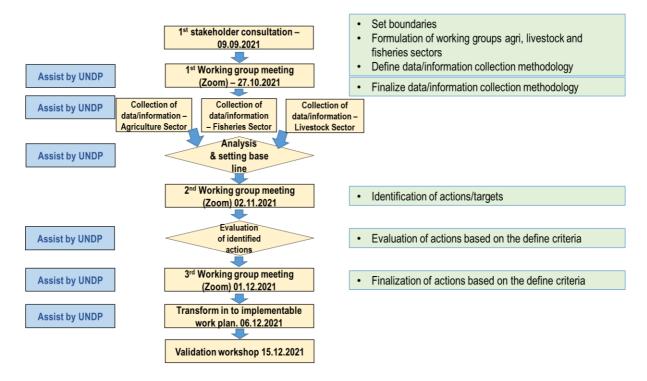

It is obvious that the general public is always trying to move towards convenient lifestyles and they are not paying much attention on complex operations like domestic biogas systems even though it gives better return on investment (Rol). This is why the solar systems are becoming popular even with high initial cost. Once a solar system is installed on the roof top, there is not much operation and maintenance involvement except for cleaning the panel when required. When introducing a technology or a system, it is needed to take in to account these social aspects, otherwise the entire project will fail.

Agro-industry is one of the major income generating industries in Sri Lanka and with high return on investment (RoI) in most of the commercially viable technologies. With this background it seems that the financial assistance is not required for commercialization of these technologies. However, if it is possible to develop and introduce most of the interventions as projects packaging essential elements together (soft financing, technology demonstration, pilot projects, awareness programmes and monitoring) the rate of implementation can be enhanced.

#### **1.8 METHODOLOGY ADOPTED**

Since the energy usage details in most of the ground work operations in the AFL sector is not readily available, more effort has been given to establish those details. Some of the required details have been taken from the information available in open sources mainly in web sites of ministries and departments and other ground information was collected conducting a questionnaire survey. The reference of web sites from which details were taken are given in the reference section and the details of interviewed farmers and other officials are given in the annex.

The steps followed for development of this action plan are presented in the following diagram and most of the group meetings were conducted online due to prevailing pandemic situation.

## CHAPTER 2: GOVERNMENT POLICIES, DIRECTIVES AND COMMITMENT

## 2.1 INTRODUCTION

The energy aspect in the Agro-industry covered by different policies, directives and commitments is discussed in this chapter. These policy directives have been accounted when developing the prospective actions under this energy plan.

#### 2.2 GOVERNMENT DIRECTIVES

The present Government has given a directive to agriculture sector to eliminate the use of chemical fertilizer with immediate effect and introduce/promote organic fertilizer to all crops. Under this directive in-house organic fertilizer manufacturing will be promoted and the machinery and energy requirement will be enhanced.

In addition to the policy directives given in the national energy policy document, present Government has given a directive to enhance the percentage of renewable energy in energy generation mix up to 70% by 2030.

## 2.3 ENERGY POLICY

The latest version of energy policy has been published on 09<sup>th</sup> Friday 2019 by the Ministry of Power & Energy. Working through the conflicting demands from the security, equity and sustainability dimensions, known as the energy trilemma, Sri Lanka today is seen to be moving away from the delicate balance of these three forces. The national energy policy is thus founded on ten pillars, rooted in the broad areas impacting the society, economy and the environment, in an effort to counter balance the forces through enhanced equity, security and sustainability, respectively. The strategies directly effecting to the agriculture sector are given in the following table.

Table 2.1: The strategies directly effecting agriculture sector under the energy policy

No.	No. Pillar Strategy	
01	Providing	New productive uses for electricity in agriculture, rural and primary
	Access to	industries will be encouraged with emphasis on empowerment of women
	Energy	and youth
	Services	To encourage prospective small and medium scale industries and
		businesses, the initial cost of obtaining an electricity connection, which may
		be considerable at present compared with the capital cost of the business,
		will be reduced by offering a special concessionary package under which the
		entire cost of the transformer for contract demands up to 100kVA will be
		waived-off and be socialized through distribution tariffs. This should be
		fully implemented from January-2021by CEB/LECO, accompanied with an
		appropriate campaign giving wide publicity through media.
02	Improving	Expert energy advisory services will be offered through state and private
	Energy	sector service providers to promote energy efficiency, conservation and
	Efficiency and	energy cost reduction across all end use sectors.
	Conservation	

## 2.4 NATIONALLY DETERMINED CONTRIBUTIONS (NDCs)

Government of Sri Lanka submitted updated nationally determined contributions (NDCs) in July 2021 and it is expected to achieve a reduction of GHG emissions against the BAU scenario by 7% in the agriculture and livestock sectors (4% unconditionally and 3% conditionally) equivalent to an estimated mitigation level of 2,477,400 MT CO2e unconditionally and 1,858,000 MT CO2e conditionally (total of 4,335,400 MT CO2e) of carbon dioxide equivalent during the period of 2021 to 2030 by implementing the updated NDCs [2]. The energy related NDCs identified in this document is given following table.

NDC No.	NDC and Action		
NDC 03	Improve adoption of renewable energy for crop farming/value addition		
	3.1 Application of solar PV and wind energy (or hybrid) for agriculture practices		
	3.2 Promote grid electricity use in place of fossil fuel driven engine powered pumps		
	3.3 Renewable energy powered mini grid for clustered agriculture farming in vulnerable		
	areas (as a pilot)		
	3.4 Explore and develop small hydro power potential in irrigation water canals for		
	agriculture purpose		
NDC 06	Adopt renewable energy for livestock applications		
	E.g. small-scale solar-powered refrigeration to increase the milk storage facilities, solar-		
	powered can-coolers for milk producers, solar energy for milk collection, chilling centers,		
	farm operation and processing; and introducing biogas digesters for large scale livestock		
	& poultry, dairy processing and abattoirs		

Table 2.2: The NDCs directly effecting to the agriculture sector

## 2.5 AGRICULTURE POLICY

The Government has unveiled the drafted National Agriculture Policy towards achieving the vision of "sustainable food security to achieve national prosperity. The policy is primarily focused on food and feed crops, and sustainable food security with improved food quality and has set multiple goals to be achieved by 2030. The drafted policy has identified fifteen policy statements under ten thematic areas and 144 policy actions. Out of these the energy related policy actions are given in the following table.

Table 2.2. Energy related	noligy actions in the	e National Agriculture Policy
1 able 2.5. Ellergy related	1 poincy actions in the	e National Agriculture Policy

No.	Thematic Area	Policy Statement	Policy Action
01	Eco-friendly Operations	Support sustainability in agriculture development through conservation and	Take appropriate measures to <b>increase the use</b> <b>of renewable energy in agriculture</b> – e.g. financial incentives to access solar-energy and wind powered technology/ battery-powered technology for irrigation, cold-storage systems and use of biogas
02		utilization of natural resources while safeguarding ecosystem services	Introduce and adopt eco-friendly agricultural practices across agro-ecosystems to support environmental conservation
03	Input Management	Strengthen delivery	Establish a mechanism to certify machinery
		and management	and other agricultural inputs to be used in Sri

		operations of	Lanka (e.g. a central regulatory entity for

## CHAPTER 3: DATA AND INFORMATION

## 3.1 INTRODUCTION

Data and information related to energy and machinery use in the AFL sectors in Sri Lanka is not readily available in open sources. The national energy balance is published by Sri Lanka Sustainable Energy Authority every year but the energy use in AFL sectors are not separately represented and it is accounted under domestic sector. Some information about the cost of machinery use in cultivation of vegetable and fruits are available in the booklet "Cost of cultivation of agriculture crops" an annual publication by the Socio Economic and Planning Center, Department of Agriculture, Peradeniya and production details of paddy, vegetables, fruits and other crops are available in both Ministry of Agriculture and Department of Agriculture web sites. Also, production statistics in fisheries sector and livestock sector are available in statistics reports published by Ministry of Fisheries and Department of Animal Production and Health, Peradeniya.

Due to the absence of energy consumption data in cultivation, growing and semi processing, sample survey has been carried out in Ampara, Batticaloa and Trincomalee Districts and the summary of those data are presented in this chapter. Considering the prevailing COVID-19 situation, this survey has been conducted via online.

The specific energy consumption for each operation has been established based on the details taken from the questionnaire survey and the results are given in the following tables.

### 3.2.2 FISHERIES SECTOR

Key statistics of the fisheries sector in the Eastern Province is given in the following table.

No.	Description	Results
	Marine Fishing	
01	No of multi day boats	647
02	Out-board engine fiberglass reinforced plastic boats	758
03	Motorized traditional boats	204
04	Non-motorized traditional boats	8,056
05	No of small harbors (Thotupola)	150
	Average annual fish catch	59,680 ton
	Inland Fishing	
06	No of inland tanks	299
07	Total tanks area	38,000 hectares
08	Alternative tanks	
09	Inland fishing crafts	2430
	Average annual fish catch	20,120 tons (22.3% of total annual catch)
	Shrimp Farm	
10	No of ponds	178
11	No of farms	66
12	Total pond area	110 hectares
13	Annual production	421 tons
14	Major energy consuming equipment	Water pump and paddle wheel (aerate
		the pond)

## CHAPTER 4: BASELINE ANALYSIS

### 4.1 INTRODUCTION

As indicated above, analysis of baseline of energy use in the AFL sector is a difficult task due to absence of readily available data. However, an attempt has been taken to establish a few baselines taking the data and information presented in chapter 2 and making several assumptions, and the results are presented in this chapter.

Most of the vegetables are harvested within 45 to 55 days. Considering this the farmers in some areas are practicing 4 to 5 cultivation seasons for these vegetables. Water pumping in vegetable farming consumes considerable amount of energy. However, water is not required in rainy days and the seasonal variations, mainly the rainfall pattern have been studied and accounted when establishing baseline details below.

Multiplied the specific energy use (eg. Diesel consumption for plough per acre) with the total volume (eg. Total land area) and thereby the total energy consumption has been established in each crop for each operation.

### 4.2 LIMITATION OF THIS ANALYSIS

The accuracy of these analysis is depending on the accuracy of the data and information. The data taken for this analysis have been taken from open sources and a questionnaire survey. The data gathered from the questionnaire survey is accurate but operating frequency of the machineries (Land preparation, water pumping, spraying etc.) are varying from area to area. Taking in to consideration all the variables, average figures have been established and presented in this chapter.

#### Recommendation for enhancing the accuracy of data

It is recommended to carry out the data collection survey in detail enhancing the survey population every year and establish more accurate specific indicators.

#### 4.3 FORECASTING

Forecasting in agriculture sector is a regular exercise and it is being done in provincial and national level in two scenarios. One is immediate forecasting for next season and the other one is five-year forecasting development of programmes accordingly. However, with the present Government's new directives of achieving 100% organic fertilizer, it is required to revisit these plans and amend accordingly. The recommendations made in this document will be useful when amending these plans.

Forecasting in fisheries sector is conducted with different models developed (eg. Auto Regressive Integrated Moving Average model) mainly for enhancing the fish catch. With these new technologies the traveling time can be minimized and thereby the overall energy usage can be optimized.

#### 4.4 AGRICULTURE SECTOR

#### 4.4.1 AVERAGE VALUES TAKEN FOR ESTABLISHING THE ENERGY USE

Following average values have been taken from the data presented in Chapter 3 when estimating the energy use in agriculture industry

- Availability of electricity or solar powered pumps 20% of total land area
- Loading factor of a pump -75% (due to the availability of rain, supplying water is not necessary at the whole time period)

#### 4.4.2 RESULTS

Description Results			
Specific energy requirement per acre per season	64 liters diesel and 6 liters of		
	petrol		
Total land area for both seasons	287,570 Acres		
Total energy requirement per year			
Land preparation	11,502,760 Liters of diesel		
Harvesting	6,901,650 liters diesel		
Spraying	1,725,414 Liters of petrol		

Table 4.2: Energy use in vegetable cultivation – 4 seasons per year

Description	Results	
Specific diesel/kerosene requirement per acre per season for	22.5 liters diesel

Electricity saving use of solar pumps	37,350 kWh		
Total energy use in spraying	116,720 Liters petrol		

Table 4.4: Energy use in fruits cultivation

Description	Results		
Specific diesel/kerosene requirement per acre per season for land preparation	22.5 liters diesel		
Specific electricity requirement per acre per season for water pumping	42 kWh		
Specific diesel requirement per acre per season for water pumping	59 Liters of diesel		
Specific electricity generation per acre per season for water pumping in solar pumps	4 kWh		
Specific electricity requirement per acre per season for spraying	9.76 liters of petrol		
Specific electricity requirement per acre per season for grass cutting	18 liters of petrol		
Total land area per seasons- Watering fruits	8,406 Acres		
Total land area per seasons- Non watering fruits	3082 Acres		
Total energy use in land preparation	230,300 liters		
Total energy use in water pumping			
Electricity	431,275 kWh		
Diesel/kerosene	605,300 liters		
Electricity saving use of solar pumps	40,350 kWh		
Total energy use in spraying	99,880 Liters petrol		
Total energy use in grass cutting	240,075 liters petrol		

#### 4.5 ENERGY BALANCE

#### 4.5.1 SHARE OF ENERGY IN AGRICULTURE SECTOR

The total energy balance by crops in agriculture sector is given in the figure 4.1. The energy consumption in paddy cultivation is the highest in Eastern Province and rest of the energy is shared equally among vegetable and fruits cultivation

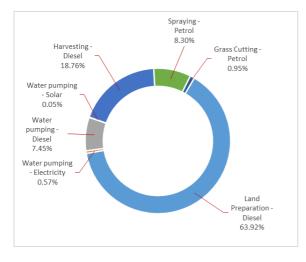

Figure 4.2: Share of energy by process

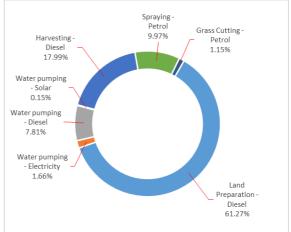

Figure 4.3: Share of energy cost by process

Out of the total energy consumption in agriculture sector (cultivation) land preparation and harvesting consume 64% and 18% respectively. Water pumping is the next and it shares around 8.0% of the total energy.

#### 4.5.2 SHARE OF ENERGY IN PADDY PRODUCTION

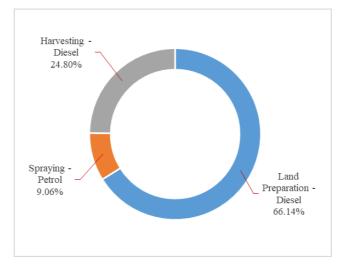

Figure 4.4: Energy usage pattern in paddy production

# 4.5.3 SHARE OF ENERGY AND ENERGY COST IN VEGETABLE (4 SEASONS PER YEAR) CULTIVATION

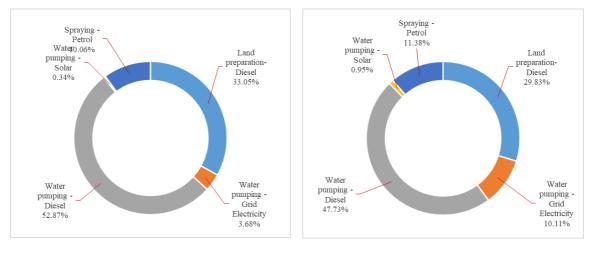

Figure 4.5: Energy share by process

Figure 4.6: Energy cost share by process

The energy consumption and energy cost variation pattern in short rotation vegetable crops are given in the above figures. More than 50% of total energy consumption shares are for water pumping and approximately 33% for land preparation.

#### 4.5.4 SHARE OF ENERGY AND ENERGY COST IN VEGETABLE (2 SEASONS PER YEAR) CULTIVATION

## 4.5.5 SHARE OF ENERGY AND ENERGY COST IN FRUITS CULTIVATION

Figure 4.9: Energy share by process

Figure 4.10: Energy cost share by process

## 4.5.6 THE ANALYSIS OF EMBEDDED ENERGY

The analysis of embedded energy or the energy required to produce one kg of paddy, vegetable and fruit is given in the following table. The average percentage of embedded energy to the total energy taken out from paddy, vegetable and fruit production is in the range of 4.0% to 5.5%.

Similar analysis has been done for other three provinces (North Western, Uva and Southern provinces) and the above embedded energy figures are considerably higher in these three provinces compared to Eastern province. Use of machinery mainly in land preparation is easy in Eastern province due to flat terrain and there by the specific energy use is considerably low in these areas than the other provinces. Also, in average the yield is 12% to 14% is higher in Eastern province than the other three provinces. As a result of these two factors, the

embedded energy in food production in Eastern province is considerably less than the other three provinces.

A production process with share of embedded energy less than 10% has been cited as productive in international research literature. The above cultivation processes can be found within that range. Ideally in the calculation of embedded energy indirect energy usage in the entire product lifecycle should also be accounted, but it would still not exceed the 10% margin and therefore is considered negligible in this case.

Сгор	Embedded Energy (Emergy) - kJ/kg of product	Total Energy in Food - kJ/kg	%
Paddy	635	11524	5.51
Vegetables - 4 seasons	852	16500	5.16
Vegetables - 2 seasons	668	16500	4.05
Vegetables - 2 seasons (No watering)	761	16700	4.56
Fruits (Annual crops)	568	15100	3.76
Fruits (Permanent Crops)	672	15100	4.45

#### Table 4.5: Energy usage in agriculture sector

#### 4.6 FISHERIES SECTOR

#### 4.6.1 ASSUMPTIONS MADE FOR ESTABLISHING THE ENERGY USE

Table 4.6: Assumptions made for establishing the energy use in fisheries sector

No.	Description	Results	
01	Average fishing days per year per boat	300	
02	No of paddle wheels in one acre shrimp tank	5 with 2kW motor	

#### 4.6.2 RESULTS

#### Table 4.7: Energy usage in fisheries sector

No.	Description	Results
01	Total annual diesel usage in multiday boats	20,204,150 liters
02	Total annual kerosene/petrol usage in single day boats	31,705,000 liters
04	Average annual kerosene consumption in inland fishing	607,500 liters
05	Electricity usages for operating aerators in shrimp ponds	2,376,000 kWh

## 4.7 LIVESTOCK SECTOR

#### 4.7.1 RESULTS

Table 4.8: Energy g	generation in livestock sector
---------------------	--------------------------------

No.	Description	Results
01	Energy generation in biogas units	846 m <sup>3</sup>

Energy consumption in livestock sector is not substantial than the other sectors. Some of the energy use cannot be quantified due to lack of field data. Biomass is used in curd production in Eastern province but is difficult to quantify at this stage, and it is recommended to conduct a survey and establish the energy use in this process.

## CHAPTER 5: ANALYSIS ON GREEN ENERGY POTENTIAL IN AGRO-INDUSTRY

### 5.1 INTRODUCTION

This analysis has been done based on the results of the baseline analysis presented in the chapter 04. Further, this analysis has been limited to energy consumption in production (growing, farming and fishing) and semi processing activities. Commercially and technically proven technologies have been considered under this section. Also, the up-scaling potential and operating performance under the local climatic conditions have been considered when analyzing green energy potential in AFL sectors.

#### 5.1.1 OFF-GRID RENEWABLE ENERGY APPLICATION

#### 5.1.1.1 Solar Water Pumping

It has been estimated approximately 4500 diesel water pumps are being operated for vegetable cultivation in the Eastern Province. These pumps are operating in electricity non-accessible areas/places. In average 3 to 5 liters of diesel is consumed per acre per day in vegetable farming and one diesel pump is serving for two acres. This operation can be partially replaced with 2-inch solar powered pump in day time. In early stages of the vegetable cultivation, water is supplied in early mornings and evenings and direct solar pumps are not suitable for this operation unless high head (approximately 60 foot) storage is available and only the day time diesel pumps usage can be eliminated.

The cost of the solar water pumps is not uniform in Sri Lankan market, however cost of a standardized solar pump is in the range of Rs. 500,000.00 to Rs. 800,000.00. The approximate diesel saving would be around 130 liters per month per pump and the simple payback period of this replacement would be around 2.6 years to 4.2 years.

#### 5.1.1.2 Other Solar Applications

*Solar insect traps* are available in international market with 12V battery and solar charging system and can be used as an off-grid system. These traps are generally used for night time flying insects and need to select the appropriate system before using. The energy usages in these units are not significant and equivalent  $CO_2$  savings are negligible, but practically it has an impact on increasing productivity in agriculture sector. Use of solar energy in *elephant fences* are recommended since most of those operations are in remote areas where grid electricity supply is not available. The electricity usage in these units is considerably small and the technology has been developed with battery storage for easy operations and those systems are available with attractive price in the open market now. *Solar home standalone systems* are available in open market similar to the elephant fencing technology and can be used in both huts, shelters in agricultural lands and in night time inland and lagoon fishing. With this intervention, the existing kerosene usage can be minimized. The other technology is *solar powered aerators for shrimp farming.* Battery operated aerators or aerators only for day time without battery are available in the market. There are 178 shrimp farming ponds having 110 hectare land area in the Eastern Province and approximately 4 to 5 aerators are utilized in one acre area. The power requirement in one aerator (paddle wheel) is

approximately 1-2.2 kW and the equivalent  $CO_2$  saving would be around 9,550 tons per annum with this solar technology intervention.

### 5.1.1.3 Biomass Applications

Use of high-quality energy sources like electricity is not encouraged for low temperature (low quality) applications as per the principals of thermodynamics. There are plenty of low temperature drying and low temperature hot water applications available in Agro-industry mainly for drying crops and washing, cleaning and cooking in institutions like training centers. Locally fabricated low temperature dryers and low temperature hot water generators fueled by biomass are available in open market now with attractive prices. Potential is there to eliminate the existing electricity, kerosene or LPG usage in Agro-industry by introducing these systems and thereby reduction of carbon foot print.

### 5.1.1.4 Biogas for thermal applications

Use of biogas in thermal application is not a new intervention but the issues existing in this sector have not been properly addressed. Most of the individual small-scale biogas units have been abandoned in the Eastern Province mainly due to social aspects. Therefore, it is better to carry out a situation analysis on use of biogas and establish proper criteria on suitability of use of biogas. There are 22,400 cattle farms in the Eastern Province and theoretically establishment of biogas units in all these places are possible.

## 5.1.2 ON-GRID RENEWABLE ENERGY APPLICATIONS

### 5.1.1.1 Solar roof top systems

Solar roof top systems are encouraged by the Government of Sri Lanka under three systems viz. solar net metering, solar net accounting and solar net plus scheme. The national grid is acting as an energy bank and the generated electricity during day time either can be utilized at the site or excess can be fed in to the grid. Electricity generation and the consumption are metered in separate meters and electricity bill is calculated end of the month accordingly. More details about solar roof top are available at the Ceylon Electricity Board, Sri Lanka Sustainable Energy Authority and Public Utilities Commission of Sri Lanka web sites.

The electricity consumption can be offset with the net metering scheme and a sample analysis of solar roof top system is given in the following table. In general maximum 5 kW solar system is recommended by CEB for a house with single phase electricity supply. If someone needs to enhance the solar capacity further, three phase supply is required and the solar roof top system capacity can be enhanced up to 15kW.

No.	Land area - hectares	Average monthly electricity use including house load - kWh	Monthly electricity bill – Rs.	Equivalent solar roof top system - kW	Simple payback period - Years
01	1	226	6133.50	2	4
02	2	352	11803.50	4	4
03	3	550	20713.50	5	3

Since the electricity supply is available island wide, electrically driven Agro machineries such as water pumps, milk can coolers, sprayers, threshers, dryers etc. are favorably utilizing the

CEB national grid in many areas rather introducing solar standalone systems. The overall energy efficiency in the solar standalone water pumping system is comparatively lower than the solar roof top system. This is due to storing electricity in batteries and conversion from DC to AC. The required electricity can be offset through solar roof top system. Since the electricity network has reached 100% households and installation of solar rooftop systems are possible in most of the areas, it will be a more practical reliable solution since the solar roof top systems are regulated through Sri Lankan Standards SLS 1552, SLS 1542 to SLS 1547, SLS 1553 and SLS 1554.

#### 5.1.3 BIOMASS APPLICATIONS- SMALL SCALE POWER GENERATION

A feasibility study has been carried out by UNDP Sri Lanka office to ascertain the viability of establishing small scale biomass power plants in Sri Lanka. As per the results of this study, the most viable technology for small scale biomass power plant is steam turbine-based power generation system. According to the analysis done under this study, seven strategic locations have been identified in the Eastern Province with total potential capacity of 7MW and annual biomass requirement to run these systems would be around 130,300 tons. Agriculture waste has been considered as the prospective source of biomass under this study and if these proposals were implemented, potential market will be there to supply biomass at a reasonable cost.

#### 5.1.4 BIOGAS APPLICATIONS- POWER GENERATION

Power generation with biogas driven engine is not a new application to Sri Lanka. There is a grid connected power plant in Attanagalla with 80kW generating capacity driven by biogas and biogas is generated using poultry waste.

#### 5.1.5 ENHANCEMENT OF ENERGY UTILIZATION EFFICIENCY

Energy consumption in paddy cultivation is substantially higher than the energy consumption in other crops and this is mainly for land preparation and harvesting. Four-wheel tractors, two-wheel tractors and combine harvesters are being utilized in many places for this purpose and introduction of productive machineries (having higher output and less down time) in these categories are very much encouraging and there by potential saving of diesel is substantial.

## CHAPTER 6: RECOMMENDATIONS

## 6.1 INTRODUCTION

The results of the questionnaire survey and the results of the analysis done in chapter 5 have been considered when developing these recommendations.

# 6.2 POPULARIZATION OF TECHNICALLY AND COMMERCIALLY VIABLE TECHNOLOGIES

A number of programmes have been initiated for introduction of green energy technologies in the Eastern Province of which some have succeeded and others failed. Some of these projects are assisted by donors and others are partially or fully funded by the Government. Taking in to consideration the success and failure factors of past programmes, it is recommended to design a comprehensive programme to introduce technically and financially viable green energy technologies to the AFL sectors.

## 6.3 CROSS-SECTORAL RECOMMENDATIONS

## 6.3.1 INTRODUCTION OF SOFT LOAN FACILITIES

One of the major difficulties faced in promoting and implementing RE applications in the Agro-Industry is lack of financial capability and the investment load. Many of the RE technology applications require a very high initial cost, which creates a wide gap in the technology requirement and actual application. Therefore, it is essential to incorporate financial assistance models when introducing these technologies to the market.

There is a substantial number of soft loan schemes available through both public and private banks in Sri Lanka, but awareness level is very low within the farmer communities. The information should be effectively communicated to the farmers and the loan facilities should be easily accessible.

## 6.3.2 INTRODUCTION OF NEW TECHNOLOGIES

The importance of use of machineries for cultivation and semi processing activities has been emphasized in many occasions when carrying out the field data survey for collection of energy consumption details in cultivation and semi processing. The main objective of this initiative is to reduce the manpower involvement in this sector. Farmers highlighted two major issues. Moving away of the young generation from agriculture activities is the first issue and gradual reduction of human power is the second issue. One of the direct solutions to overcome the negative impact of the above mentioned issues is introduction and enhancement of use of machineries and systems in agriculture sector. Use of mini tillers, use of sprinkler and drip irrigation systems are some of the examples and they are expecting advanced technologies for other activities such as planting seeds and plants, weeding, applying fertilizer etc.

# 6.3.3 ENHANCEMENT OF KNOWLEDGE ON RENEWABLE ENERGY & ENERGY EFFICIENCY

One of the major reasons for RE and EE applications to backfire is the lack of knowledge and awareness among the farmer communities. It is very important to educate the farmers and other sector related persons including government officials, service providers, and technology suppliers. It should be emphasized that the government is encouraging 100% organic farming, and use of clean energy sources combined with energy efficiency measures have a number of benefits including creating environmental sustainability, reducing energy cost, and increasing income margins.

## 6.3.4 DATA RECORDING AND INFORMATION SHARING

With the technological developments in the agriculture field, the need for a reliable and accessible information network has become prominent. As a promising solution the Food and Agriculture Organization (FAO) and International Telecommunication Union (ITU) have introduced the concept of e-agriculture, developing the 'Sri Lanka E-Agriculture Strategy' and 'E-Agriculture Action Plan 2016-2020). This discusses the methods of integrating agricultural technology with ICT introducing recommended actions for practical implementation. Recommended actions include increasing the availability and accuracy of agricultural information by creating, updating, analyzing and linking critical databases, developing accessible, affordable, and secure ICT platforms, networks, and devices, and improving the financing, investing and banking outreach to agriculture sector leveraging on electronic and mobile technologies. Unlike in the old days, the younger generation is more familiar with digital interfaces and smart applications creating high probability of success for this e-agriculture concept. A preliminary initiative has been taken under the UNDP NAMA project jointly with SLSEA by creating the EnerGIS data reporting web portal. This should be further enhanced to upload and share agro data.

## 6.3.5 DEMONSTRATION SITES

Demonstration sites are proved to be effective extension tools used in the AFL sectors. They provide an opportunity for the farmers to observe and study new technologies under similar environmental and practical conditions they are familiar with. This approach is quite welcome in the farmer communities as it enables them to reach out for better technological options without any investment risk. With the hands-on experience gained through training at demonstration sites, they are capable of making educated choices with more confidence.

Existing sites with sufficient facilities (i.e. land extension, accessibility) can be developed in to demonstration sites to practice sustainable energy solutions including EE measures and RE technologies with predicted beneficial outcomes. How the site is to be funded needs to be clear and guaranteed for the proposed life of the demonstration site. Standard practices and conditions that need to be maintained should be clearly defined and a reliable recording system and an effective communication plan needs to be developed.

## 6.4 RECOMMENDATIONS - AGRICULTURE SECTOR

## 6.4.1 EFFICIENCY ENHANCEMENT IN AGRICULTURE MACHINERIES

The future of Agriculture field is largely relying on machineries and tools with the technological developments in the sector. Use of machineries for cultivation and semi processing activities has enabled covering up for the decrease in man-power and has enhanced the productivity.

In addition to this, land preparation and harvesting activities account for the largest energy share in crop cultivation as shown in Chapter 4. Mainly these two steps are using agriculture machineries driven by diesel and petrol (in small scale machineries) fuel rather than electricity. Therefore, efficiency enhancement in these machineries and targeted training of drivers and field workers is a crucial step in applying energy saving measures.

Continuous research and field trials are needed for the improvement of the machinery as well as to enhance the efficiency. However, it is not very practical to apply provincial level activities to achieve measurable savings in terms of energy. A National level approach such as setting standards and quality control measures on machinery imports is more appropriate, as it will gradually lead efficient equipment to penetrate the market. Regulatory provisions are already available with local authorities like the Sri Lanka Sustainable Energy Authority.

#### Sri Lanka Sustainable Energy Authority Act, No. 35 of 2007

Section 35 (2)

For the purpose of carrying out its responsibilities under subsection (1), the Board shall: -

(f) implement energy labeling programs for appliances and devices and establish benchmarks;

Section 36 (2) For the purpose of ensuring that the benchmarks established under subsection (1) are being complied with, the Board may, where it considers it necessary:-

(c) monitor, with the consent of all relevant persons concerned, energy consumption in buildings and industrial premises and monitor fuel efficiency of land vehicles, ships and aircrafts, in association with relevant agencies;

(f) enforce limits and codes of practices for existing and proposed buildings, industrial premises, land vehicles, ships and aircraft, in association with relevant agencies;

## 6.5 RECOMMENDATIONS - LIVESTOCK SECTOR

## 6.5.1 STUDY ON UTILIZATION OF BIOGAS UNITS

Biogas technology has been in existence since early 1970's in Sri Lanka, but has not become popular compared to other RE technologies such as solar energy. Even though large-scale biogas units are a highly preferred solution for the AFL sectors considering the clean energy production, environmental friendly organic waste management, and generation of bio fertilizer, its application is seen mostly limited to lighting, cooking and heating in domestic level and small-scale production of bio fertilizer in the agro-industry. Several studies including the UNDP Energy NAMA project have been performed over time to identify the issues related to backfiring of biogas application. These studies have conveyed that the bio degradation process itself and the routine maintenance practices required to function the system smoothly have been largely disregarded when promoting the technology within farmer communities. Further studies should be conducted with practical intervention and trial studies to assess the compatibility of the biogas technology with existing practices in AFL sectors.

## 6.5.2 BIOMASS HOT WATER GENERATORS FOR CURD INDUSTRY

Boiling milk in curd making process is mainly done using either biomass stoves or LPG stoves. Controlling the temperature precisely in this process is difficult. Also, maintaining the hygienic condition is difficult since most of the stoves are built in open spaces.

Use of biomass fired hot water generator is an ideal solution to overcome these issues and the quality of products can be enhanced. A yoghurt manufacturing facility is available at Dikoya which is equipped with a biomass hot water generator and overall productivity has enhanced in to a better level than the business as usual operation after this initiative.

## 6.5.3 SMALL SCALE MILK CAN COOLERS FOR STORING MILK AT DOMESTIC LEVEL

Small scale dairy farming is a common livelihood among the farmer community in the Eastern Province of Sri Lanka, housing 22,400 cattle farmers. The milk produced is transported to collecting centres without any form of cooling, which can result in low hygienic conditions. A cow produces around 10 litres of milk in the morning, and 6 litres in the evening. Due to lack of facilities farmers have stopped collecting the evening milk causing additional on-farm losses. Small scale on-farm milk cooling systems with insulated milk cans are being used worldwide as an immediate solution to these issues.

No	Prospective technologies	Nos of techno	ology require	ed	Average capacity in one center
		Trincomalee	Batticaloa	Ampara	
1	Small scale milk can coolers	50	25	40	5 (Trinco)
2	Solar roof top systems	11	25	23	1
3	Biomass boilers for curd industry	12	5		1
4	Solar Irrigation Unit		10		
5	Solar Water Pump		40		
6	Solar Power sales Centre		10		
	Biogas Generation				Average capacity in one unit
1	Units available		19	3	
2	Future potential	12	100	20	8kg (Trinco)

## 6.6 RECOMMENDATIONS - FISHERIES SECTOR

Since renewable energy and energy efficiency interventions are still at the preliminary phase in the fisheries sector, it is recommended to introduce new technologies through research & trial, pilot studies, and practical demonstrations.

Energy consumption in shrimp farming process in Eastern Province is substantial. Mainly the aerators of the shrimp ponds are the major energy consumer. Since the grid electricity is available in most of these places, solar roof top systems are recommended to offset the grid electricity consumption and battery-operated aerators are recommended to the places where the grid electricity is non accessible.

## CHAPTER 7: ACTIVITY PLAN

## 7.1 INTRODUCTION

The results based action plan is considered for implementation of green energy technologies and systems in the AFL sectors in Eastern Province. The priority has been given to easily implementable and high impact actions and new technologies considered separately under R&D section since these have not been proven as commercially and technically viable technologies.

## 7.2 ACTIVITIES

No.	Sector	Intervention	Activity
		Training And Capacity Building	Training Agriculture Inspectors
1		on RE And EE technologies/systems	Training programs for farmer producer organizations
2			Introduction of solar roof top systems
3		Renewable Energy Applications	Solar home systems for sheds, huts, farms
4	Cross-Sectoral		Establish demonstration sites
5	Activities	Data recording and information sharing	Upgrading energy consumption and production data platforms
6		Financial assistance through commercial/regional banks	Introduction of soft loan facilities
7			Solar powered battery-operated insects control system
8		Application research on new technologies	Testing of new machineries for land preparation, digging holes, planting, fertigation, weeding, etc.
9			Solar water pumps supportive programme
10			Introduction of battery operated sprayers
11	Agriculture Sector	Popularization of commercially viable technologies	Temperature and RH controlled food storage system
12		-	Chipping machines for green matters (pruning material, grasses, branches etc.)
13			Biomass fired food dehydrators – maize, fish
14			Small scale milk can coolers
15	Livestock Sector	Popularization of commercially	Biogas systems – large units
16		viable technologies	Biomass fired hot water generators for curd making process
17	Fisheries Sector	Popularization of commercially	Solar powered aerators for shrimp farming
18		viable technologies	Solar thermal powered fish dryers

#### Table 7.1: Recommended activities for the action plan

AG -01 Training and Capacity Building on RE & EE Technologies
Background: One of the main barriers in promoting sustainable energy technologies in the Agro-Industry is lack of knowledge and awareness among the sector community. It is very rarely that the energy and agricultural sectors collaborate to make sustainable development plans, or foster an effective approach for smooth technology transfer. This results in isolated energy systems that are non-productive and non-progressive. Knowingly, the very few energy related projects considering the Agro-Industry in Sri Lanka have not been sustained well in the industry. This failure is largely owing to the fact that there is no accessible and reliable knowledge regarding the adopted energy systems, and technology support is not readily available. It is a priority requirement to create awareness and provide training and capacity building on sector related energy aspects and the RE & EE Technologies among different levels in the Agro-Industry, including government officials, service providers, technology suppliers, and farmer communities.
<b>Objective:</b> Creating awareness and capacity building on sector related energy aspects and the RE & EE technologies among different levels in the Agro-Industry
Main Targets: To be set by the executing party
Recommended Actions

#### Upgrading energy consumption and production data platforms

**Background:** With the technological developments in the agriculture, fisheries, and livestock sectors the need for a reliable and accessible information network has become prominent. As a promising solution the Food and Agriculture Organization (FAO) and International Telecommunication Union (ITU) have introduced the concept of e-agriculture, developing the 'Sri Lanka E-Agriculture Strategy' and 'E-Agriculture Action Plan 2016-2020'). This discusses the methods of integrating agricultural technology with ICT introducing recommended actions for practical implementation. Recommended actions include increasing the availability and accuracy of agricultural information by creating, updating, analyzing and linking critical databases, developing accessible, affordable, and secure ICT platforms, networks, and devices, and improving the financing, investing and banking outreach to agriculture sector leveraging on electronic and mobile technologies. Unlike in the old days, the younger generation is more familiar with digital interfaces and smart applications creating high probability of success for this e-agriculture concept. A preliminary initiative has been taken under the UNDP NAMA project jointly with SLSEA by creating the EnerGIS data reporting web portal. This should be further enhanced to upload and share energy consumption and production data of all sectors.

**Objective:** Popularization of commercially viable technologies through establishment of demonstration sites

Main Targets: To be set by the executing party

## AG -07 Solar powered battery-operated insect control system

**Background:** Pest control is an important requirement in farming, and chemical pesticides are still used as the fastest and most effective method for this purpose. However, chemical pesticides are health hazards and environmental pollutants, and with the government encouraging 100% organic farming practices, it has become a concern of the farmers to look for pest control methods other than the use of pesticides. Traditional methods of pest control such as crop rotation, intercropping, and growing insect repellent weeds are usually effective but the knowledge and practical experience on how to apply these methods properly have not been passed through generations. The solar powered insect traps are a very attractive effective alternative developed with the advancements in agricultural technology. They are simple devices that include a rechargeable battery powered by solar energy, which is used to light a LED bulb that lure and trap the insect pests. The bulb can automatically light up when there is no sun, and stay up to 4 hours after sunset.

**Objective:** Popularization of commercially viable technologies through establishment of demonstration sites

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

# Testing of new machineries for land preparation, digging holes, planting, fertigation, weeding, etc.

**Background:** The agriculture sectors in all the leading countries with an agriculture-based economy such as China, India, and Bangkok have been developed with research and experiment. It is essential that new machineries are tested and developed regularly for introducing to the field, as the man power in agriculture sector is visibly decreasing. Many people from the younger generation are shifting to livelihood methods other than farming, and the fitness and strength of people have also become less, reducing the capacity to engage in field work.

Objective: To enhance overall productivity of the Agro-Industry

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Continuous updating of technology database
- 2. Conducting trial studies through research and development

#### Solar water pumps supportive programme

**Background:** Water pumping is one of the major energy consuming process in agriculture sector. Electricity, fossil fuel (diesel/kerosene) or solar powered pumps are being used for this purpose and out of these about 80% of pumps are operating with fossil fuel.

Solar powered water pump is not a new technology for Sri Lanka. The first solar pump project has been implemented in 2006. However, lifetime of most of the pumps introduced during last 16 years period were not more than 2 years. This is mainly due to selection of low-quality technologies and absence of proper after sales services. In this situation, farmers are very reluctant to use solar powered water pumps as an alternative source to the kerosene pumps. Some of the pumps are being successfully operated during last five to seven years period with proper maintenance and most of these pumps are produced under European standard.

Compared with the kerosene or diesel engine driven pumps, solar powered water pumps are economical and the simple payback period would be around 2.5 to 3.0 years. The major issue in solar powered water pumps are intermittent operation (Fluctuation of the output with respect to the variation of solar irradiation) and to eliminate this issue, water storage at a higher elevation is required.

It is expected to provide technical guidance for existing users in operation and maintenance and potential users in selecting and purchasing the pumps through this supportive system.

**Objective:** Introduction of technology sound solar powered water pumping system as an alternative to the diesel/kerosene pumps with proper after sales services and affordable cost.

Main Targets: To be set by the executing party

#### **Recommended Actions**

- 1. Conduct a comprehensive study on the performance of solar powered water pumps in agriculture sector and identify failures and success stories and identify suitable technologies (eg. AC power pumps with inverters, DC power pumps, pumps with oil cooled motor and electronically controlled, pumps with water cooled motors etc.)
- 2. Develop few demonstration sites with best technologies covering major agriculture areas
- 3. Education and training programmes on solar pumping and solar technologies
- 4. Implement star rating system for solar water pumps and discourage use of low performance pumps
- 5. Introduce lifecycle-based procurement system

		D
AU	L	U

#### **Introduction of battery-operated sprayers**

**Background:** Sprayers are widely used in agriculture to apply pesticides, herbicides, and fertilizers to the field. Currently there are two types of sprayers used in Sri Lanka, the conventional hand operated sprayers and the petrol engine driven sprayers. Hand operated sprayers work through an air pump that compresses air and release the liquid with a pressure. The applicator must pump the air with a handle lever before spraying. This is suitable for small plantations, but is not feasible for large scale plantations spreading over several acres.

Petrol engine driven sprayers use the technology of a DC motor pump powered by a rechargeable battery. They require much less man power, are less heavy, and are more convenient to use compared to the hand operated sprayers. Both the grid electricity and solar charging can be used to recharge the batteries, and once charged it can spray up to 20 tanks making it very convenient to use. Some models come with the pump control feature including a speed regulator so as to control the speed of the pump output that suits your spraying needs. Many long-term benefits are associated with the petrol engine driven sprayers including cost and time efficiency. These are low maintenance devices and spare parts are readily available in the market.

**Objective:** Applying RE based technologies for creating user-friendly, easily operated and reliable technological advancements and attending to gender responsive technology needs

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Introducing suitable financial assistance model (i.e. 50% government fund and 50% owner's fund)
- 2. Introducing easy payment modes
- 3. Introducing soft loan schemes through development banks

#### Stakeholders

As identified by the executing party

#### Temperature and RH controlled food storage system

**Background:** Food products are easily perishable under ambient temperatures, and therefore it is very important to maintain controlled environment in storage spaces to increase the shelf life of stored food preserving their nutritional qualities. The study is focused on short term storage of agricultural crops on site during the transfer period from farmers to transporters. Amongst the existing technologies, thermally driven air conditioner and relative humidity control systems are favored currently. Optimum conditions are maintained at 25-35 C temperature and 60-65 % RH for most of the food products including potatoes, ginger, turmeric, black pepper and other spices. This storage system has been effectively adapted in Dambulla and Jaffna for the storage of enasal (cardamom) and onions respectively. Storage capacity for a substantial storage of 100\*30 ft is approximately 600 - 700 K kilograms of onion which requires a 1.5 kW machine to run the system maintaining optimum conditions. Energy use is negligible compared to the output and the payback period for the investment in building the system is usually less than one year depending on the market parameters.

**Objective:** Introduce RE based advanced technologies to minimize wastage of food and ensure constant market supply

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Awareness through demonstration sites
- 2. Financial support systems (grants /soft loan facilities)

# Chipping machines for green matters (pruning material, grasses, branches etc.)

**Background:** Discarding agricultural waste is a problem faced by many small-scale farmers. Cutting, drying, and processing bio waste is strenuous and time consuming, and first-hand burning is harmful for the environment. As a solution for this, small-scale chipping machines/ agricultural shredders can be used for chopping agricultural waste, farm waste and garden waste and convert them to compost manure. Government is encouraging 100% organic farming, and the use of these shredders to produce natural compost manure with bio waste would be both economically advantageous and promoting sustainable agriculture technology. Additionally when plant waste is directly used in composting process, some parts will remain undigested which have to be separated from the manure. Chipping will eliminate this need enhancing the productivity of composting process. A range of bio waste products such as pruning material, dry and wet coconut fronds/husks, harvested banana trees can be processed in these chipping machines. Different models are available such as Tractor PTO agriculture shredders (prevalent in Sri Lankan market), Mini Tractor operated shredder machine, Electric shredder machine, Coconut Shredder Machine, and Garden Shredder Machine, etc.

**Objective:** Applying RE based technologies for introducing user-friendly, easily operated and reliable technological advancements and attending to gender responsive technology needs

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Awareness through demonstration sites
- 2. Financial support systems (grants /soft loan facilities)

#### Stakeholders

As identified by the executing party

#### **Biomass fired food dehydrators**

**Background:** Drying/ dehydration is a critical step in post-harvest treatment procedure, which is necessary to avoid spoilage/molding of crops due to moisture and increase shelf life during storage. Food products with low-medium moisture content (<30% wet basis) such as paddy, maize, sesame seeds, legumes, etc. are dried and food products with high moisture content (>50%) such as fruits, vegetables, fish, meat, etc. are dehydrated in the process. Traditionally drying involved capturing direct heat from the sun, but with the technological advancements in the Agro-Industry mass harvesting is more common making it difficult to use sun drying effectively. Using biomass fired food dehydrators is a more efficient and convenient option for the drying process. They are designed optimizing parameters like the moisture removal rate, drying rate, thermal efficiency, and heat transfer efficiency to obtain optimum results while preserving the physical and nutritional qualities of the food products. Biomass pellets, saw dust, wood pellets can be used as the heat source in these dehydrators and the capacity can be as high as 500 kg/hr.

Objective: Establishing Micro industries in rural level and value addition of agricultural products

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Awareness through demonstration sites
- 2. Financial support systems (grants /soft loan facilities)

#### Stakeholders

#### **Biogas Systems- Large Units**

**Background:** Biogas technology has been in existence since early 1970's in Sri Lanka, but has not become popular compared to other RE technologies such as solar energy. Biogas application is seen mostly limited to lighting, cooking and heating in domestic level and small-scale production of bio fertilizer in the agroindustry. Several studies including the UNDP Energy NAMA project have been performed over time to identify the issues related to backfiring of biogas application. These studies have conveyed that the bio degradation process itself and the routine maintenance practices required to function the system smoothly have been largely disregarded when promoting the technology within farmer communities. Hence lack of knowledge and preparedness causes efficiency drop in the biogas systems and raise dissatisfaction among its users. There are no proper regulations or policies related to biogas promotion and application in Sri Lanka, except for some environmental standards imposed on solid waste management and waste water treatment in swine farming. If these issues are addressed properly, large scale biogas units are a highly preferred solution for the Agro-Industry considering the clean energy production, environmental friendly organic waste management, and generation of bio fertilizer.

Objective: Popularization of commercially viable technologies through establishment of demonstration sites

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 3. Identifying potential implementation sites
- 4. Providing site specific solutions to overcome implementation barriers
- 5. Awareness through demonstration sites
- 6. Financial support systems (grants /soft loan facilities)

AG -16 Biomass fired hot water generators for curd making process
Background: Value added productions like buffalo curd holds an important share of small-scale dairy farming business in Sri Lanka. In most of the cases this is a rural family business or cottage industry where the know-hows are passed from generation to generation. As the first step in the curd production buffalo milk is boiled over an open fire for 20-30 minutes and then cooled to 35-40 °C. Heating is obtained by burning firewood. This is a crude technique associated with several disadvantages such as the inability to control temperature and mixing of burnt ash with product. Use of biomass fired hot water generators is an ideal solution to overcome these issues and the hygienic conditions and quality of products can be enhanced through this. This application has already been introduced to Dickoya area under the UNDP Biomass Project with proven capacity enhancement and can be developed further with sufficient financial aid.
<b>Objective:</b> Popularization of commercially viable technologies through establishment of demonstration sites
Main Targets: To be set by the executing party

#### Solar powered aerators for shrimp farming

**Background:** Shrimp farming is popular in the North Western and Eastern provinces in Sri Lanka. Adequate aeration is critical for shrimp farming, to keep the water clarity and produce healthful harvest. A sort of mechanical aeration is used for this purpose, most commonly being floating electric aerators with plastic paddle wheels and long arm aerators in the Asian culture.

This utilizes a considerable amount of energy, and most of the shrimp farms are located in places that find it difficult to access the national grid. As an alternative, solar powered push flow aerators with rotating impellers can be used with a high success rate. They are small, simple floating devices that can be easily used as an off-grid application. Use of renewable energy makes it more sustainable and environmental friendly, and will increase the income margin due to decrease in energy cost.

Objective: Popularization of commercially viable technologies through establishment of demonstration sites

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 5. Enhancing technology availability in the market
- 6. Awareness through demonstration sites

#### Solar thermal powered fish dryers

**Background:** Raw fish meat contains around 80% moisture making it a highly perishable food. Drying is an important technique used in the fisheries sector to preserve fish increasing the shelf life and storage period, preventing wastage of excess harvest, and maintaining a consistent a supply to the market. Open sun drying is the most attractive and prevalent method used, as it is very effective in tropical regions such as Sri Lanka, is easy to handle, and does not require much technical or financial capacity. But it also has its disadvantages like requiring a large open space exposed to direct sunlight, slow and non-uniform drying, and low hygiene due to fish being exposed to dust, bird and animal attacks. Solar thermal powered fish dryers are a simple and preferable alternative to open sun drying, that make use of solar energy with more advanced and efficient technology. It is more suitable for drying small fish and the only disadvantage compared to other drying methods is not being able to use when there is no sun light.

Objective: Popularization of commercially viable technologies through establishment of demonstration sites

Main Targets: To be set by the executing party

#### **Recommended Actions**

It is recommended to build actions to deliver targets through the following strategies.

- 1. Enhancing technology availability in the market
- 2. Awareness through demonstration sites

## CHAPTER 9: IMPLEMENTATION ARRANGEMENT OF THE ACTION PLAN

The Ministry of Agriculture, Fisheries unit, Department of Irrigation, Department of Agriculture and Department of Animal Production will be implementing this green energy action plan individually and the Chief Secretary's office will be executing it. A results based action plan is proposed under this analysis report and based on the availability of resources and the budget, the annual targets need to be finalised. A common template is proposed in chapter 07 and it will help to monitor the implementations of proposed actions precisely.

## 9.1 IMPLEMENTATION ARRANGEMENT OF THE GREEN ENERGY ACTION PLAN

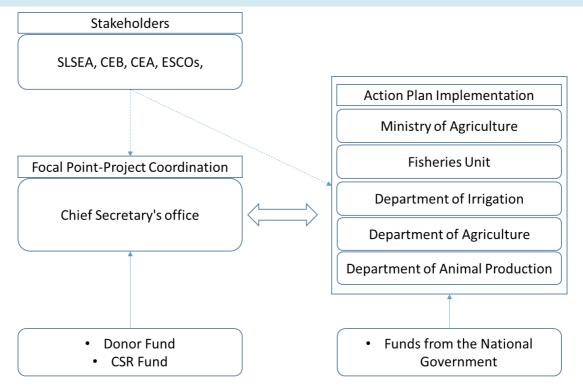

Fig 9.1: Implementation arrangement of the action plan

## 9.1.1 GOVERNING FRAMEWORK

Coordination, monitoring and implementation assistance will be provided by the Focal Point-Project Coordination established in the Chief Secretary's office, Eastern Province and the implementation of the action plan will be done individually by the relevant Ministries and the departments.

## Focal Point- Project Coordination will be specifically responsible for:

Liaising with the donor agencies, CSR funding sources and channeling the fund for implementing partners.

Coordination with relevant institutions for obtaining technical assistance in implementation of the action plan.

Monitoring the progress and ensuring smooth operation.

### Implementing partners will be specifically responsible for:

Liaising with the Financial Commission, and line Ministries for budgeting requirement.

Development of annual action plan based on the available resources and Government directives.

Implementation of the action plan and reporting the progress.

## 9.1.2 STEERING COMMITTEE FOR IMPLEMENTATION OF THE ACTION PLAN (SC)

Chairman	Chief Secretary, Eastern Province
Secretary	Secratery or nominee
Responsibility	Guidance & direction for enhancing the overall productivity
Meetings	Once in 4 months

A Steering Committee (SC) for implementation of the green energy action plan will be officially appointed by the chief secretary. The SC will include members representing the Agriculture, Fisheries and Livestock sector relevant institutions. The heads of participating public sector institutions will be invited to SC meetings as necessary. The Chief Secretary of the Eastern Province or his/her nominee will act as the Secretary and convener of the SC. The SC will meet as often as required, but will meet at least once in every 4 months.

## 9.1.3 FINANCIAL MANAGEMENT

Finances available at donors and CSR funds will be channeled through the Focal Point- Project Coordination and the implementation progress will be monitored. Government funds will be directly channeled to the relevent implementation institutions following the existing prevaling mechanisms.
